

# Package ‘TIMP’

April 26, 2007

**Type** Package

**Title** a problem solving environment for fitting superposition models

**Version** 1.2

**Date** 2007-04-26

**Author** Katharine M. Mullen, Ivo H. M. van Stokkum

**Maintainer** Katharine M. Mullen <kate@nat.vu.nl>

**Depends** R (>= 2.5.0), methods, tcltk, vcd, fields, gplots, splines

**Suggests** gclus

**Description** Measurements often represent a superposition of the contributions of distinct sub-systems resolved with respect to many experimental variables (time, temperature, wavelength, pH, polarization, etc). A parametric model for each component may be desirable to apply to the data, but only to the evolution of components with respect to a subset of the independent variables. For instance, given time-resolved spectroscopy data, a parametric model for the time-evolution of components may be available, while a physically-inspired parametric model for the spectra of components may be difficult to formulate and interpret. Such situations give rise to a separable nonlinear parameter estimation problem, namely that of estimating the (nonlinear) parameters associated with the parametric model, while estimating parameters representing the evolution of components with respect to the independent variables to which a parametric model does not apply as conditionally linear. The partitioned variable projection algorithm is well-suited to solving such problems under the criteria of efficiency, quality of standard error estimates, and precision of parameter estimates. TIMP implements the partitioned variable projection algorithm and allows its application to fitting a wide range of models, including those for the simultaneous analysis of multiple datasets collected under different experimental conditions. The package has been extensively applied to modeling data arising in spectroscopy experiments.

**License** GPL version 2 or newer

baseIRF

*Baseline subtraction from a vector, usually representing an IRF.*

---

## Description

Baseline subtraction from a vector, usually representing an IRF.

## Usage

```
baseIRF(irfvec, indexlow, indexhigh, removeNeg = FALSE)
```

## Arguments

irfvec	Vector to subtract a baseline from
indexlow	Lowest index to base the baseline estimation on
indexhigh	Highest index to base the baseline estimation on
removeNeg	Whether negative values should be replaced with 0.

## Details

Currently estimates the baseline as the mean of data between indexlow and indexhigh, and subtracts the result from the entire vector.

## Value

vector

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

**Examples**

```
irfvec <- rnorm(128, mean=1)
plot(irfvec, type="l")
irfvec_corrected <- baseIRF(irfvec, 1, 10)
lines(irfvec_corrected, col=2)
```

---

dat-class

---

Class "dat" for model and data storage

---

**Description**

`dat` is the super-class of other classes representing models and data, so that other model/data classes (e.g., `kin` and `spec` for kinetic and spectral models respectively) also have the slots defined here. These slots may be specified in the `...` argument of the `initModel` function.

**Objects from the Class**

Objects from the class can be created by calls of the form `new("dat", ...)` or `dat(...)`, but most are most often made by invoking another function such as `readData` or `initModel`.

**Slots**

**psi.df:** Object of class "matrix" dataset from 1 experiment

**psi.weight:** Object of class "matrix" weighted dataset from 1 experiment

**x:** Object of class "vector" time or other independent variable.

**nt:** Object of class "integer" length `x`

**x2:** Object of class "vector" vector of points in 2nd independent dimension, such as wave-lengths of wavenumbers

**n1:** Object of class "integer" length `x2`

**C2:** Object of class "matrix" concentration matrix for simulated data

**E2:** Object of class "matrix" matrix of spectra for simulated data

**sigma:** Object of class "numeric" noise level in simulated data

**mod\_type:** Object of class "character" character string defining the model type, e.g., "kin" or "spec"

**parnames:** Object of class "vector" vector of parameter names, used internally

**finished:** Object of class "logical" describes whether optimization is complete

**simdata:** Object of class "logical" logical that is TRUE if the data is simulated, FALSE otherwise; will determine whether values in C2 and E2 are plotted with results

**weightpar:** Object of class "list" list of vectors `c(first_x, last_x, first_x2, last_x2, weight)`, where each vector is of length 5 and specifies an interval in which to weight the data.

`first_x` first(absolute, not an index) `x` to weight

`last_x` last (absolute, not an index) `x` to weight

**first\_x2** first (absolute, not an index)  $\times 2$  to weight

**last\_x2** last (absolute, not an index)  $\times 2$  to weight

**weight** numeric by which to weight data

Note that if vector elements 1-4 are NA (not a number), the firstmost point of the data is taken for elements 1 and 3, and the lastmost points are taken for 2 and 4. For example, `weight_par = list(c(40, 1500, 400, 600, .9), c(NA, NA, 700, 800, .1))` will weight data between times 40 and 1500 picoseconds and 700 and 800 wavelengths by .9, and will weight data at all times between wavelength 700 and 800 by .1. Note also that for single photon counting data `weightpar = list(poisson = TRUE)` will apply poisson weighting to all non-zero elements of the data.

**weight:** Object of class "logical" TRUE when the specification in `weightpar` is to be applied and FALSE otherwise

**weightM:** Object of class "matrix" weights

**weightsmooth:** Object of class "list" type of smoothing to apply with weighting; not currently used

**fixed:** Object of class "list" list of lists or vectors giving the parameter values to fix (at their starting values) during optimization.

**clp0:** Object of class "list" list of lists with elements `low`, `high` and `comp`, specifying the least value in `x2` to constrain to zero, the greatest value in `x2` to constrain to zero, and the component to which to apply the zero constraint, respectively. e.g., `clp0 = list(list(low=400, high = 600, comp=2), list(low = 600, high = 650, comp=4))` applies zero constraints to the spectra associated with components 2 and 4.

**makeps:** Object of class "character" specifies the prefix of files written to postscript

**clpequspec:** Object of class "list" list of lists each of which has elements `to`, `from`, `low`, `high`, and optional element `dataset` to specify the dataset from which to get the reference `clp` (that is, a spectrum for kinetic models). `to` is the component to be fixed in relation to some other component; `from` is the reference component. `low` and `high` are the least and greatest absolute values of the `clp` vector to constrain. e.g., `clpequspec = list(list(low = 400, high = 600, to = 1, from = 2))` will constrain the first component to equality to the second component between wavelengths 400 and 600. Note that equality constraints are actually constraints to a linear relationship. For each of the equality constraints specified as a list in the `clpequspec` list, specify a starting value parameterizing this linear relation in the vector `clpequ`; if true equality is desired then fix the corresponding parameter in `clpequ` to 1. Note that if multiple components are constraints, the `from` in the sublists should be increasing order, (i.e., `list(to=2, from=1, low=100, high=10000)`, `list(to=3, from=1, low=10000, high=100)`), not `list(to=3, from=1, low=10000, high=100)`, `list(to=2, from=1, low=10000, high=100)`)

**lclp0:** Object of class "logical" TRUE if specification in `clp0` is to be applied and FALSE otherwise

**lclpequ:** Object of class "logical" TRUE if specification in `clpequspec` is to be applied and FALSE otherwise

**title:** Object of class "character" displayed on output plots

**mhlist:** Object of class "list" list describing fitting history

**datCall:** Object of class "list" list of calls to functions

**drel** vector of starting parameters for dataset scaling relations

**dscalspec:** Object of class "list"

**drel:** Object of class "vector" vector of starting parameters for dataset scaling relations

**clpequ:** Object of class "vector" describes the parameters governing the clp equality constraints specified in `clpequspec`

**scalx:** Object of class "numeric" numeric by which to scale the  $x$  axis in plotting

**prel** vector of starting values for the relations described in `prelspec`

**prel:** Object of class "vector" vector of starting values for the relations described in `prelspec`

**prelspec:** Object of class "list" list of lists to specify the functional relationship between parameters, each of which has elements

  what1 character string describing the parameter type to relate, e.g., "kinpar"

  what2 the parameter type on which the relation is based; usually the same as what1

  ind1 index into what1

  ind2 index into what2

  rel character string, optional argument to specify functional relation type, by default linear

  e.g., `prelspec = list(list(what1 = "kinpar", what2 = "kinpar", ind1 = 1, ind2 = 5))` relates the 1st element of kinpar to the 5th element of kinpar. The starting values parameterizing the relationship are given in the `prel` vector

**fvecind:** Object of class "vector" vector containing indices of fixed parameters

**pvecind:** Object of class "vector" used internally to store indices of related parameters.

**groups:** Object of class "list" list containing lists of pairs  $c(x2 \text{ index}, \text{dataset index})$ . the  $x2$  values (which are solved for as conditionally linear parameters) are equated for all pairs in a list.

**iter:** Object of class "numeric" describing the number of iterations that is run; this is sometimes stored after fitting, but has not effect as an argument to `initModel`

**clpCon:** Object of class "list" used internally to enforce constraints on the clp

**ncomp:** Object of class "numeric" describing the number of components in a model

**clpdep:** Object of class "logical" describing whether a model is dependent on the index of  $x2$

**inten:** Object of class "matrix" for use with FLIM data; represents the number of photons per pixel measured over the course of all times  $t$  represented by the dataset. See the help for the `readData` function for more information.

**positivepar:** Object of class "vector" containing character strings of those parameter vectors to constrain to positivity, e.g., `positivepar=c("kinpar")`

### Examples

```
# simulate data

C <- matrix(nrow = 51, ncol = 2)
k <- c(.5, 1)
t <- seq(0, 2, by = 2/50)
```

```

C[, 1] <- exp( - k[1] * t)
C[, 2] <- exp( - k[2] * t)
E <- matrix(nrow = 51, ncol = 2)
wavenum <- seq(18000, 28000, by=200)
location <- c(25000, 20000)
delta <- c(5000, 7000)
amp <- c(1, 2)
E[, 1] <- amp[1] * exp( - log(2) * (2 * (wavenum - location[1])/delta[1])^2)
E[, 2] <- amp[2] * exp( - log(2) * (2 * (wavenum - location[2])/delta[2])^2)
sigma <- .001
Psi_q <- C

# initialize an object of class dat
Psi_q_data <- dat(psi.df = Psi_q, x = t, nt = length(t),
x2 = wavenum, nl = length(wavenum))

# initialize an object of class dat via initModel
# this dat object is also a kin object
kinetic_model <- initModel(mod_type = "kin", seqmod = FALSE,
kinpar = c(.1, 2))

```

---

examineFit

*Examines the results of a call to fitModel*

---

## Description

Examine the results of a call to [fitModel](#) by a call to plotting functions; call this function with argument an object returned from [fitModel](#). Possibly also supply a new specification of plots to be generated.

## Usage

```
examineFit(resultfitModel, opt=vector())
```

## Arguments

resultfitModel	list returned by a call to <a href="#">fitModel</a>
opt	possibly an object of class <code>opt</code> giving options for plotting; if <code>opt</code> has length zero (the default) then the plotting options given in the <code>opt</code> list of <code>resultFitModel</code> are applied

## Details

The [fitModel](#) function returns a list of results, and initiates plotting functions. Given the `resultfitModel` list [fitModel](#) returns, `examineFit` initiates the plotting functions, and thus may be used to examine results.

<code>fit-class</code>	<i>Class "fit" to store the results of model fitting associated with all datasets analyzed.</i>
------------------------	---

---

**Description**

Class to store results of model fitting associated with all datasets in a single call to the `fitModel` function. An object of class `fit` is stored in the slot `fit` of objects of class `multimodel`.

**Objects from the Class**

Objects can be created by calls of the form `new("fit", ...)`.

**Slots**

**resultlist:** Object of class "list" that contains an object of class `res` for each dataset modeled, in the order that they were specified.

**nlsres:** Object of class "list" containing named elements

`onls` output of the call to `nls` used in model optimization.

`sumonls` result of call `summary(onls)`

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

**See Also**

---

<code>fitModel</code>	<i>Performs optimization of (possibly multidataset) models.</i>
-----------------------	---

---

**Description**

Performs optimization of (possibly multidataset) models and outputs plots and files representing the fit of the model to the data.

**Usage**

```
fitModel(data, modspec=list(), datasetind = vector(), modeldiffs = list(),
          opt = opt() )
```

**Arguments**

- `data` list of data objects of class `dat`
- `modspec` list whose elements are models of class `dat` describing the models as results from a call to the function `initModel`
- `datasetind` vector that has the same length as `data`; for each dataset in `data` specify the model it should have as an index into `modspec`; default mapping is that all datasets use the first model given in `modspec`
- `modeldiffs` list whose elements specify any dataset-specific model differences.
  - `dscal` list of lists specifying linear scaling relations between datasets; each list has elements `to`, `from`, `value`. The index of the dataset to be scaled is given in `to`; the index of the dataset on which the scaling is to be based is given in `from`. The starting value parameterizing the relationship is given as `value`. For example, `dscal = list(list(to=2, from=1, value=.457))`.
  - `thresh` numeric describing the tolerance with which `clp` from different datasets are to be considered as equal. For instance, for two datasets containing data at 750 and 751 nm, respectively, `thresh=1.5` will equate the `clp` at 750 and 751 between datasets. Specify a negative value of `thresh` to estimate `clp` per-dataset. See Section 2.2 of the paper in the references for the model equations.
  - `free` list of lists specifying individual parameters to free for a given dataset. each sublist has named elements
    - `what` character string naming parameter type, e.g., "kinpar"
    - `ind` vector of indices into parameter vector or list, e.g., `c(2, 3)` or 4
    - `dataset` dataset index in which parameter is to be freed
    - `start` starting value for freed parameter
 For example, `free = list( list(what = "irfpar", ind = 1, dataset = 2, start=-.1932), list(what = "kinpar", ind = 5, dataset = 2, start=.0004), list(what = "kinpar", ind = 4, dataset = 2, start= .0159))`.
  - `remove` list of lists specifying individual parameters to remove from parameter groups for a given dataset. each sublist has named elements
    - `what` character string naming parameter type, e.g., "kinpar"
    - `dataset` dataset index in which parameter group is to be removed
    - `ind` vector of indices into parameter vector or list, e.g., `c(2, 3)` or 4 where parameter should be removed
  - `add` list of lists specifying individual parameters to add to parameter groups for a given dataset. each sublist has named elements
    - `what` character string naming parameter type, e.g., "kinpar"
    - `dataset` dataset index in which parameter group is to change
    - `start` starting value for added parameter
    - `ind` vector of indices into parameter vector or list, e.g., `c(2, 3)` or 4 where parameter should be added.
  - `change` list of lists specifying entire parameter groups to change for a given dataset. each sublist has named elements
    - `what` character string naming parameter type, e.g., "kinpar"
    - `dataset` dataset index in which parameter group is to change
    - `spec` new specification that in `initModel` would follow "what", e.g., for `c(.1, .3)` if `what="kinpar"`

`rel` list of lists specifying parameters to relate between datasets each sublist has named elements  
`what1` character string naming parameter type to be determined in relation to some other parameter type , e.g., "kinpar"  
`what2` character string naming parameter type on which another parameter type is to depend, e.g., "kinpar"  
`ind1` vector of indices into parameter vector or list, e.g., `c(2, 3)` or 4 of the dependent parameter.  
`ind2` vector or numeric of indices into parameter vector or list, e.g., `c(2, 3)` or 4 of the parameter on which another parameter will depend  
`dataset1` dataset index of the dependent parameter  
`dataset2` dataset index of the parameter on which another parameter will depend  
`rel` optional character string describing functional relationship between parameters; defaults to "lin" for linear relationship  
`start` starting value or vector of values parameterizing relationship between parameters  
`opt` Object of class `kinopt` or `specopt` specifying fitting and plotting options.

## Details

This function applies the `nls` function internally to optimize nonlinear parameters and to solve for conditionally linear parameters (clp) via the partitioned variable projection algorithm.

## Value

list with element `toPlotter`.

`toPlotter` is a list containing all arguments used by the plotting function; it is used to regenerate plots and other output by the `examineFit` function

normal-bracket116bracket-normal

---

getClpindepX-methods

*Generic function getClpindepX in Package ‘TIMP’*

---

### Description

Gets the matrix associated with nonlinear parameter estimates for the case that this matrix is not re-calculated per conditionally linear parameter.

### Usage

```
getClpindepX(model, multimodel, theta, returnX, rawtheta, dind)
```

### Arguments

model	Object of class <code>dat</code> ; function switches on this argument.
multimodel	Object of class <code>multimodel</code> used in standard error determination
theta	Vector of nonlinear parameter estimates.
returnX	logical indicating whether to return a vectorized version of the X matrix
rawtheta	vector of nonlinear parameters; used in standard error determination
dind	numeric indicating the dataset index; used in standard error determination

[dat-class](#)

---

getResid

*For data correction, fits a model (but ignores plotting commands) in order to obtain the SVD of the residuals, which then can be used in data-correction.*

---

### Description

For data correction, fits a model exactly as does `fitModel` (but ignores plotting commands) in order to obtain the SVD of the residuals. These residuals can then be subtracted away from the original data to some extent with the `preProcess` function.

### Usage

```
getResid(data, modspec=list(), datasetind = vector(), modeldiffs = list(),
         opt = opt() )
```

**Arguments**

<code>data</code>	As in the <code>fitModel</code> function
<code>modspec</code>	As in the <code>fitModel</code> function
<code>datasetind</code>	As in the <code>fitModel</code> function
<code>modeldiffs</code>	As in the <code>fitModel</code> function
<code>opt</code>	As in the <code>fitModel</code> function

**Value**

list containing the first five left and right singular vectors of the residuals, as well as the first five singular values. A weight matrix (if used) is also included in this list.

**See Also**

[fitModel](#), [preProcess](#)

---

initModel

*Defines the model to be used in analysis.*

---

**Description**

Allows definition of a model of class "dat" to be used in analysis. The arguments specify the model.

**Usage**

```
initModel(...)
```

**Arguments**

`...` specify the model class via the character string e.g., [kin-class](#) or [spec](#) and any of the slots associated with that model type (which is a subclass of class `dat`, so that all slots in `dat` may also be specified), e.g., `mod_type = "kin"` will initialize a model with class `kin`, for a kinetic model.

**Details**

For examples, see the help files for [dat-class](#) and [fitModel](#)

**Value**

an object of class `dat` with the sub-class given by the value of the `mod_type` input.

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

**See Also**

[dat-class](#), [kin-class](#), [spec-class](#), [fitModel](#)

Internals

*TIMP function used internally***Description**

TIMP function used internally

**Details**

The functions linked to below are for direct use.

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

**See Also**[baseIRF](#), [readData](#), [preProcess](#), [initModel](#), [fitModel](#), [examineFit](#), [sumKinSpecEst](#)

kin-class

*Class "kin" for kinetic model storage.***Description**

`kin` is the class for kinetic models; if `mod_type = "kin"` is an argument of `initModel`. All objects of class `kin` are sub-classes of class `dat`; see documentation for `dat` for a description of these slots.

**Details**See [dat-class](#) for an example of the initialization of a `kin` object via the `initModel` function.**Objects from the Class**Objects can be created by calls of the form `new("kin", ...)` or `kin(...)`.**Slots**

**kinpar** vector of rate constants to be used as starting values for the exponential decay of components; the length of this vector determines the number of components of the kinetic model.

**specpar**: Object of class "list" parameters for spectral constraints

**seqmod**: Object of class "logical" that is TRUE if a sequential model is to be applied and FALSE otherwise

**irf**: Object of class "logical" that is TRUE if an IRF is modeled and FALSE otherwise

**mirf**: Object of class "logical" that is TRUE if a measured IRF is modeled and FALSE otherwise

**measured\_irf**: Object of class "vector" containing a measured IRF

`convalg`: Object of class "numeric" 1-4 determining the numerical convolution algorithm used in the case of modeling a measured IRF

`irffun`: Object of class "character" describing the function to use to describe the IRF, by default "gaus"

`irfpar`: Object of class "vector" of IRF parameters; for the common Gaussian IRF this vector is ordered `c(location, width)`

`dispmu`: Object of class "logical" that is TRUE if dispersion of the parameter for IRF location is to be modeled and FALSE otherwise

`dispmufun`: Object of class "character" describing the functional form of the dispersion of the IRF location parameter; if equal to "discrete" then the IRF location is shifted per element of `x2` and `parmu` should have the same length as `x2`. defaults to a polynomial description

`parmu`: Object of class "list" of starting values for the dispersion model for the IRF location

`disptau`: Object of class "logical" that is TRUE if dispersion of the parameter for IRF width is to be modeled and FALSE otherwise

`disptaufun`: Object of class "character" describing the functional form of the dispersion of the IRF width parameter; if equal to "discrete" then the IRF width is parameterized per element of `x2` and `partau` should have the same length as `x2`. defaults to a polynomial description

`partau`: Object of class "vector" of starting values for the dispersion model for the IRF FWHM

`fullk`: Object of class "logical" that is TRUE if the data are to be modeled using a compartmental model defined in a K matrix and FALSE otherwise

`kmat`: Object of class "array" containing the K matrix descriptive of a compartmental model

`jvec`: Object of class "vector" containing the J vector descriptive of the inputs to a compartmental model

`ncolc`: Object of class "vector" describing the number of columns of the C matrix for each clp in `x2`

`kinscal`: Object of class "vector" of starting values for branching parameters in a compartmental model

`kmatfit`: Object of class "array" of fitted values for a compartmental model

`cohspec`: Object of class "list" describing the model for coherent artifact/scatter component(s) containing the element `type` and optionally the element `numdatasets` if `type` is "irf", the coherent artifact/scatter has the time profile of the IRF. if `type` is "freeirfdisp" the coherent artifact/scatter has a Gaussian time profile whose location and width are parameterized in the vector `coh`. if `type` is "irfmulti" the time profile of the IRF is used for the coherent artifact/scatter model, but the IRF parameters are taken per dataset (for the multidataset case), and the integer argument `numdatasets` must be equal to the number of datasets modeled. if `type` is "seq" a sequential exponential decay model is applied, whose parameters are contained in `coh`. if `type` is "mix" a sequential exponential decay model is applied along with a model that follows the time profile of the IRF; the coherent artifact/scatter is then a linear superposition of these two models.

`coh`: Object of class "vector" of starting values for the parameterization of a coherent artifact

`wavedep`: Object of class "logical" describing whether the kinetic model is dependent on `x2` index (i.e., whether there is clp-dependence)

`lambdac`: Object of class "numeric" for the center wavelength to be used in a polynomial description of `x2`-dependence

**Extends**

Class `dat-class`, directly.

**Author(s)**

`dat-class`, `spec-class`

---

`kinopt-class`

*Class "kinopt" stores options for fitting and plotting kinetic models*

---

**Description**

Class "kinopt" stores options for fitting and plotting kinetic models in particular; this is a subclass of class `opt` that contains options applicable to all model types

**Details**

See `opt-class` and `specopt-class` for the specification of fitting/plotting options that are not specific to the class type and for the `kin` class type, respectively.

**Objects from the Class**

Objects can be created by calls of the form `new("kinopt", ...)` or `kinopt(...)`

**Slots**

**notraces:** Object of class "logical" that defaults to FALSE; if TRUE, do not plot traces

**selectedtraces:** Object of class "vector" containing x indices for which plots of traces are desired under a kinetic model

**breakdown:** Object of class "list" with the following elements:

`plot` vector of `x2` values to plot the breakdown for. These values be specified in a fuzzy way: an `x2` value within  $\text{abs}(x2[1] - x2[2])/100$  a value given in `plot` means that a plot for that `x2` value will be generated, where the reference `x2[1]` and `x2[2]` are from the first dataset modelled.

`tol` numeric giving a tolerance by which the values in `plot` are compared to `x2` values for near-equality. The default is defined as  $\text{abs}(x2[1] - x2[2])/100$ .

`superimpose` vector of dataset indices for which results should be superimposed if the dataset has an `x2` value at a value in `plot`.

**FLIM:** Object of class "logical" that defaults to FALSE; if TRUE, the data represent a FLIM experiment and special plots are generated.

**kinspecest** Object of class "logical" that defaults to FALSE; if TRUE, make a plot of the spectra associated with the kinetic components as well as the lifetime estimates.

**kinspecerr** Object of class "logical" that defaults to FALSE; if TRUE, add standard error estimates to the spectra a plot generated with `kinspecest=TRUE`. This option can only be used if the estimates were generated during fitting via the option `stderrclp=TRUE`

- specinterpol** Object of class "logical" that defaults to FALSE; if TRUE, use spline instead of lines between the points representing estimated spectra
- specinterpolpoints** Object of class "logical" that defaults to TRUE; if TRUE, add points representing the actual estimates for spectra to plots of the curves representing smoothed spectra
- specinterpolseg** Object of class "numeric" that defaults to 50; represents the number of segments used in a spline-based representation of spectra
- specinterpolbspline** Object of class "logical" that defaults to FALSE; determines whether a B-spline based representation of spectra is used (when specinterpol=TRUE) or a piecewise polynomial representation
- normspec** Object of class "logical" that determines whether spectra are normalized in plots
- writespecinterpol** Object of class "logical" that defaults to FALSE; if TRUE, a spline-based representation of spectra is written to ASCII files

modifyModel	<i>Allows the starting values for parameters associated with a model to be updated with the values found in fitting the model.</i>
-------------	--

---

### Description

Allows the starting values for parameters associated with a model to be updated with the values found in fitting the model. A call `model_w_new_starting_vals <- modifyModel(old_model)` will plug in the optimized parameter values the last model fit so that are the starting values in the model specification `model_w_new_starting_vals`.

### Usage

```
modifyModel(model = list(), newest = list(), exceptslots = vector() )
```

### Arguments

- `model` an object of class `dat` returned by `initModel`; if this argument is of `length(0)`, which is the default, then the last model fit is used (which is found in the global variable `.currModel@model`)
- `newest` an object of class `theta` containing new parameter estimates; if this argument is of `length(0)`, which is the default, then the parameter estimates associated with dataset 1 in the last model fit are used (which are found in the global variable `.currTheta[[1]]`)
- `exceptslots` a vector of character vector of slot names whose corresponding slots are to be left out of the update

**Value**

an object of class `dat` that returns the results of calling `initModel` with the new starting values.

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

<code>multimodel-class</code>	<i>Class "multimodel" for storage of multidataset models, data and the results of fitting.</i>
-------------------------------	--

---

**Description**

`multimodel` is the class to store data, a generally applicable model, a list of per-data models, a specification of per-dataset model differences, and results for the analysis of possibly many datasets. After a call to `fitModel` an object `.currModel` is initialized of the `multimodel` class.

**Details**

after a call to [fitModel](#), an object of class `multimodel` exists in the global environment as the variable `.currModel`

**Objects from the Class**

Objects can be created by calls of the form `new("multimodel", ...)` or `multimodel(...)`.

**Slots**

**data:** Object of class `"list"` of objects of class `dat` containing data

**model:** Object of class `"dat"` of class `dat` containing a model specification to be applied to all datasets

**modellist:** Object of class `"list"` of length `n` where `n` is the number of datasets given in `data`, and each element `i` is an object of class `dat` giving the dataset-specific model applicable to `data[[i]]`

**modeldiffs:** Object of class `"list"` of per-dataset model differences input as an argument to the [fitModel](#) function

**fit:** Object of class `"fit"` containing a list of results per-dataset as well as the output of optimization returned by the `nls` function.

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

multitheta-class	<i>Class "multitheta" that stores a list with one element of class "theta" for each dataset modeled.</i>
------------------	--

---

### Description

Class `multitheta` stores a list with one element of class `theta` for each dataset modeled, corresponding to the parameter estimates associated with that dataset.

### Objects from the Class

Objects can be created by calls of the form `new("multitheta", ...)` or `multitheta(...)`.

### Slots

**th:** Object of class "list" with element `i` corresponding to the `theta` object for the `i`th dataset modeled.

### Author(s)

Katharine M. Mullen, Ivo H. M. van Stokkum

### See Also

[theta-class](#), [dat-class](#)

---

opt-class	<i>Class "opt" stores options for fitting and plotting</i>
-----------	--

---

### Description

Class "opt" stores options for fitting and plotting applicable to all model types

### Details

See [kinopt-class](#) and [specopt-class](#) for the specification of fitting/plotting options that are specific to the class type.

### Objects from the Class

Objects can be created by calls of the form `new("opt", ...)` or `opt(...)`.

## Slots

**writecon:** Object of class "logical" that defaults to FALSE; if true then concentrations are written to a txt file; row labels are x

**writespec:** Object of class "logical" that defaults to FALSE; if TRUE then spectra are written to a txt file; row labels are x2

**writenormspec:** Object of class "logical" that defaults to FALSE; if TRUE then normalized spectra are written to a txt file; row labels are x2

**writefit:** Object of class "logical" that defaults to FALSE; if TRUE then fit is written to a txt file; row and column labels are x and x2

**residplot:** Object of class "logical" defaults to FALSE; if TRUE generate a plot of residuals in a separate window.

**plot:** Object of class "logical" that defaults to TRUE; if FALSE then do not write output in the form of plots and other windows to the screen.

**divdrel:** Object of class "logical" that defaults to FALSE; if TRUE, plot traces and concentration profiles divided by the dataset scaling parameters where they apply; this allows for the fit of datasets having different intensities on the same scale.

**plotkinspec:** Object of class "logical" that defaults to FALSE; if TRUE, generates a separate plot of the spectra associated with the components that are not a part of a coherent artifact/scatter model.

**superimpose:** Object of class "vector" containing dataset indices whose results should be superimposed in plots

**xlab:** Object of class "character" containing label for x-axis, e.g., "nanoseconds" or "picoseconds"

**ylab:** Object of class "character" containing label for y-axis, e.g., "wavelength"

**title:** Object of class "character" containing title to write at the top of plots.

**makeps:** Object of class "character" containing prefix to plot files written to postscript; if present postscript will be written. Note that this string is also used as the prefix of txt output files

**linrange:** Object of class "numeric" giving linear range of time axis for plotting; time will be plotted linearly from -linrange to linrange and plotted on a logarithmic (base 10) axis elsewhere

**summaryplotrow:** Object of class "numeric" giving number of rows in summary plot; defaults to 4

**summaryplotcol:** Object of class "numeric" giving number of columns in summary plot; defaults to 4

**iter:** Object of class "numeric" giving number of iterations to optimize model parameters

**paropt:** Object of class "list" of graphical parameters in format `par(...)` to apply to plots.

**stderrclp:** Object of class "logical" that defaults to FALSE; if TRUE, estimates of the standard error of conditionally linear parameters are made

**addest:** Object of class "vector" containing character strings of which parameter estimates should be added to the summary plot, e.g., `addest = c("kinpar", "irfpar")`

## Author(s)

plotter-methods	<i>Generic function plotter in Package ‘TIMP’</i>
-----------------	---

---

### Description

Methods for function `plotter` in Package ‘TIMP’ that call plotting and output functions.

### Usage

```
plotter(model, multimodel, multitheta, plotoptions)
```

### Arguments

<code>model</code>	Object of class <code>dat</code> ; function switches on this argument.
<code>multimodel</code>	Object of class <code>multimodel</code>
<code>multitheta</code>	Object of class <code>multitheta</code>
<code>plotoptions</code>	list of output options input to <code>fitModel</code> as the argument <code>opt</code>

### Author(s)

Katharine M. Mullen, Ivo H. M. van Stokkum

### See Also

[dat-class](#)

---

<code>preProcess</code>	<i>Performs preprocessing on data stored as an objects of class <code>dat</code>.</i>
-------------------------	---

---

### Description

Performs data sampling, selection, baseline correction, scaling, and data correction on an object of class `dat`.

### Usage

```
preProcess(data, sample = 1, sample_time = 1, sample_lambda = 1,
  sel_time = vector(), sel_lambda = vector(), baselinetime = vector(),
  baselinelambda = vector(), scalx = NULL, scalx2 = NULL,
  sel_lambda_ab = vector(), sel_time_ab = vector(), rm_x2=vector(),
  rm_x = vector(), svdResid = list(), numV = 0)
```

**Arguments**

<code>data</code>	Object of class <code>dat</code>
<code>sample</code>	integer describing sampling interval to take in both time and <code>x2</code> ; e.g., <code>sample=2</code> will sample every 2nd time and every 2nd point in <code>x2</code> .
<code>sample_time</code>	integer describing sampling interval in time; e.g., <code>sample_time=2</code> will sample every 2nd element of the time vector.
<code>sample_lambda</code>	integer describing sampling interval in <code>x2</code> ; e.g., <code>sample_lambda=2</code> will sample every 2nd element in the <code>x2</code> vector.
<code>sel_time</code>	vector of length 2 describing the first and last time index of data to select; e.g., <code>sel_time=c(5, 120)</code> will select data at times indexed 5-120.
<code>sel_lambda</code>	vector of length 2 describing the first and last <code>x2</code> index of data to select; e.g., <code>sel_lambda=c(5, 120)</code> will select data at <code>x2</code> indexed 5-120.
<code>baselinetime</code>	a vector of form <code>c(timeIndexmin, timeIndexmax, lambdaIndexmin, lambdaIndexmax)</code> . The average of data between <code>x2</code> indexes <code>lambdaIndexmin</code> and <code>lambdaIndexmax</code> is subtracted from data with time index between <code>timeIndexmin</code> and <code>timeIndexmax</code> .
<code>baselinelambda</code>	a vector of form <code>c(timeIndexmin, timeIndexmax, lambdaIndexmin, lambdaIndexmax)</code> . The average of data between time indexes <code>timeIndexmin</code> and <code>timeIndexmax</code> is subtracted from data with <code>x2</code> index between <code>lambdaIndexmin</code> and <code>lambdaIndexmax</code> .
<code>scalx</code>	numeric by which to linearly scale the <code>x</code> axis (which often represents time), so that <code>newx = oldx * scalx</code>
<code>scalx2</code>	vector of length 2 by which to linearly scale the <code>x2</code> axis, so that <code>newx2 = oldx2 * scalx2[1] + scalx2[2]</code>
<code>sel_lambda_ab</code>	vector of length 2 describing the absolute values (e.g., wavelengths, wavenumbers, etc.) between which data should be selected. e.g., <code>sel_lambda_ab = c(400, 600)</code> will select data associated with <code>x2</code> values between 400 and 600.
<code>sel_time_ab</code>	vector of length 2 describing the absolute times between which data should be selected. e.g., <code>sel_time_ab = c(50, 5000)</code> will select data associated with time values between 50 and 5000 picoseconds.
<code>rm_x2</code>	vector of <code>x2</code> indices to remove from the data
<code>rm_x</code>	vector of <code>x</code> indices to remove from the data
<code>svdResid</code>	list returned from the <code>getResid</code> function, containing residuals to be used in data correction.
<code>numV</code>	numeric specifying how many singular vectors to use in data correction. Maximum is five.

**Value**

object of class `dat`.

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

**See Also**

[readData](#), [getResid](#)

---

readData	<i>This function reads in data the ivo file format</i>
----------	--

---

**Description**

Data in the formats described at <http://www.nat.vu.nl/~kate/TIM/tim/node74.html> and [http://www.nat.vu.nl/~kate/FLIM\\_format](http://www.nat.vu.nl/~kate/FLIM_format) may be read from file into an R object for analysis.

**Usage**

```
readData(filenm, sep = "")
```

**Arguments**

filenm	This is the path to the file to read in, as a quoted string.
sep	This is an optional argument describing how the data is delimited; defaults to ""

**Value**

an object of class `dat`

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

[preProcess](#)

---

res-class	<i>Class "res" to store the results of model fitting associated with a single dataset.</i>
-----------	--

---

**Description**

Class to store results of model fitting associated with a single dataset. A list containing objects of class `res` is a slot in class `fit`. An object of class `fit` is stored in the slot `fit` of objects of class `multimodel`.

**Objects from the Class**

Objects can be created by calls of the form `new("res", ...)`. A `res` object is created after model fitting via the residual function `residPart`.

**Slots**

**cp:** Object of class "list" that contains the estimates for conditionally linear parameters.

**resid:** Object of class "list" of residuals, with one element for each dataset modeled.

**fitted:** Object of class "list" of fits, with one element for each dataset modeled.

**irfvec:** Object of class "list" with a vector of elements for each element of the clp x2

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

---

residPart-methods    *Generic function residPart in Package ‘TIMP’*

---

**Description**

Methods for function `residPart` in Package ‘TIMP’ determine the part of the residual vector associated with a single ‘part’ of the dataset(s).

**Usage**

```
residPart(model, group, multimodel, thetalist, clpindepX, finished, returnX,
rawtheta)
```

**Arguments**

<code>model</code>	Object of class <code>dat</code> ; switches on this argument.
<code>group</code>	list of vector pairs (x2 index, dataset index) for which the part of the residual vector is to be determined
<code>multimodel</code>	Object of class <code>multimodel</code>
<code>thetalist</code>	Object of class <code>multitheta</code>
<code>clpindepX</code>	Object of class <code>matrix</code> containing the matrix determined directly by the non-linear parameters (e.g., a concentration matrix in the case of a kinetic model) in the case that this matrix does not depend on the x2 index
<code>finished</code>	logical determining whether fitting is finished that triggers the storage of results
<code>returnX</code>	logical determining whether to just return the matrix X directly dependent on nonlinear parameters; this is used in the finite difference derivative of X used to get standard error estimates on the conditionally linear parameters.
<code>rawtheta</code>	numeric vector of nonlinear parameters to be optimized by <code>nls</code> ; this is used in the finite difference derivative of X used to get standard error estimates on the conditionally linear parameters.

**See Also**

[dat-class](#), [spec-class](#), [kin-class](#)

spec-class

Class "spec" for the storage of spectral models.

## Description

`spec` is the class for spectral models; if `mod_type = "spec"` is an input to `initModel`. All objects of class `spec` are also of class `dat`; see documentation for `dat` for a description of these slots. Note that here `x2` will refer to the independent variable in which traces are resolved, e.g., wavelength or wavenumber.

## Objects from the Class

Objects can be created by calls of the form `new("spec", ...)` or `spec(...)`.

## Slots

**clpequ:** Object of class "vector" of starting values for linear relationships between `clp`

**specpar:** Object of class "list" of vectors of starting values for spectral parameters; the number of vectors gives the number of components in the resulting spectral model; each vector contains the parameters associated with a component. e.g., `specpar = list(c(20000, 3000, .3, 21000, 2000, .4), c(18000, 1000, .2))`; the parameters in each vector are grouped `c(location_spectra, width_spectra, skew_spectra)`. the location and width parameters are given in wavenumbers.

**specfun:** Object of class "character", "gaus" for a spectral model of a superposition of skewed Gaussians; "bspline" for a bspline-based model.

**specref:** Object of class "numeric" index defining the center value of the `x2` variable.

**specCon:** Object of class "list" used internally to store constraints.

**specdisp:** Object of class "logical" TRUE if time-dependence of the spectral parameters is to be taken into account and FALSE otherwise

**specdisppar:** Object of class "list"

**specdispindex:** Object of class "list" of vectors defining those indexes of `specpar` whose time-dependence is to be modeled. e.g., `specdispindex = list(c(1,1), c(1,2), c(1,3))` says that parameters 1-3 of spectra 1 are to be modeled as time-dependent.

**nupow:** Object of class "numeric" describing the power to which wavenumbers are raised in the model equation; see Equation 30 of the paper in the references section for a complete description

**timedep:** Object of class "logical" describing whether the model for spectra `E` is dependent on `x`-index (i.e., whether it is `clp`-dependent).

**parmufunc:** Object of class "character" describing the function form of the time-dependence of spectral parameters; options are "exp" for exponential time dependence, "multiexp" for multiexponential time dependence, and "poly" for polynomial time dependence. defaults to polynomial time dependence.

**ncol** vector describing the number of columns of the `E` matrix for each value in the `x` vector

## Extends

Class `dat-class`, directly.

specopt-class

*Class "specopt" stores options for fitting and plotting spectral models*

---

**Description**

Class "specopt" stores options for fitting and plotting spectral models in particular; this is a subclass of class `opt` that contains options applicable to all model types.

**Details**

See [opt-class](#) and [kinopt-class](#) for the specification of fitting/plotting options that are not specific to the class type and for the `spec` class type, respectively.

**Objects from the Class**

Objects can be created by calls of the form `new("specopt", ...)` or `specopt(...)`

**Slots**

**nospectra:** Object of class "logical" that defaults to FALSE; if TRUE, do not plot time-resolved spectra

**selectedspectra:** Object of class "vector" containing x indices for which plots of time-resolved spectra are desired under a spectral model

**Author(s)**

Katharine M. Mullen, Ivo H. M. van Stokkum

**See Also**

[opt-class](#), [kinopt-class](#)

---

sumKinSpecEst	<i>Makes a summary plot of spectra associated with kinetic components alongside a plot showing parameter estimates</i>
---------------	--

---

## Description

Makes a summary plot of spectra associated with kinetic components alongside a plot showing parameter estimates for, by default, kinetic parameters. If the analysis had more parameters in the `addEst` slot of the argument `opt`, then more parameters are displayed. Note that this summary leaves out the spectra associated with coherent artifact or scatter.

## Usage

```
sumKinSpecEst(listFits, addtitle = TRUE, customtitle = "", preps = "",  
ylimlist=list(), kinspecerr=TRUE)
```

## Arguments

<code>listFits</code>	list of objects returned by the <code>fitModel</code> function
<code>addtitle</code>	logical regarding whether to add a title; if <code>TRUE</code> and <code>customtitle</code> is not given then the title is "Summary of EADS for: " plus the analysis titles
<code>customtitle</code>	character vector containing a title
<code>preps</code>	character vector describing the prefix of the postscript filename given as output
<code>ylimlist</code>	list with elements <code>list(ind, ylim)</code> . <code>ind</code> is an index into <code>listFits</code> ; <code>ylim</code> is the desired <code>ylim</code> for the plot for that analysis
<code>kinspecerr</code>	logical regarding whether to add error bars for to the estimated spectra.

## Details

This looks best with less than five objects in `listFits`.

## Value

## Author(s)

[fitModel](#), [examineFit](#)

theta-class

Class "theta" for storage of nonlinear parameter estimates

## Description

`theta` is the class to store parameter estimates associated with possibly many datasets; after a call to `fitModel` a list containing `n` `theta` objects for each of the `n` datasets analyzed in the call to `fitModel` is created as the invisible object `.currTheta`. To see the parameter estimates associated with the `i`th dataset, examine `.currTheta[[i]]`

## Details

after a call to `fitModel`, an object of class `theta` exists in the global environment as the variable `.currTheta`

## Objects from the Class

Objects can be created by calls of the form `new("theta", ...)` or `theta(...)`.

## Slots

**kinpar:** Object of class "vector" of rate constant estimates

**specpar:** Object of class "list" of spectral shape parameter estimates

**irfpar:** Object of class "vector" of IRF parameter estimates

**paramu:** Object of class "list" of parameter estimates describing dispersion of the location of other parameters (in time, temp., etc.)

**partau:** Object of class "vector" of parameter estimates describing dispersion of the width of other parameters (in time)

**clpequ:** Object of class "vector" of parameter estimates describing conditionally linear parameters (spectra, in a kinetic model) relations

**specdisppar:** Object of class "list" of parameter estimates describing dispersion of spectra

**kinscal:** Object of class "vector" of parameters describing kinetic relations in the context of a compartmental scheme

**prel:** Object of class "vector" of parameters describing relations between parameters (which may be linear, exponential, etc.)

**coh:** Object of class "vector" of parameters describing a coherent artifact or pulse follower.

**drel:** Object of class "vector" of parameters describing relations between datasets (linear, and possibly per-wavelength or, in general, per-clp)

TIMP-package*a problem solving environment for fitting superposition models*

---

## Description

Measurements often represent a superposition of the contributions of distinct sub-systems resolved with respect to many experimental variables (time, temperature, wavelength, pH, polarization, etc). A parametric model for each component may be desirable to apply to the data, but only to the evolution of components with respect to a subset of the independent variables. For instance, given time-resolved spectroscopy data, a parametric model for the time-evolution of components may be available, while a physically-inspired parametric model for the spectra of components may be difficult to formulate and interpret. Such situations give rise to a separable nonlinear parameter estimation problem, namely that of estimating the (nonlinear) parameters associated with the parametric model, while estimating parameters representing the evolution of components with respect to the independent variables to which a parametric model does not apply as conditionally linear. The partitioned variable projection algorithm is well-suited to solving such problems under the criteria of efficiency, quality of standard error estimates, and precision of parameter estimates. TIMP implements the partitioned variable projection algorithm and allows its application to fitting a wide range of models, including those for the simultaneous analysis of multiple datasets collected under different experimental conditions. The package has been extensively applied to modeling data arising in spectroscopy experiments.
